

# A Comparative Analysis of Factors Affecting the Adoption and Non-adoption of Orange Fleshed Sweet Potatoes among Rural Farmers in Abia State, Nigeria

J. Chah, I. Anugwa\*, I. Nwafor - University of Nigeria, Nsukka, Enugu State, Nigeria - \*Email: [ifeoma.irohibe@unn.edu.ng](mailto:ifeoma.irohibe@unn.edu.ng)

## Introduction

Orange-fleshed sweet potatoes (OFSP) have high levels of beta-carotene, which is a precursor of vitamin A. Given the potentials of OFSP and the level of awareness created by the extension unit of the National Root Crops Research Institute (NRCRI) and other collaborating institutions, it is expected that most farmers in Abia State should adopt this variety.

However, it is important to note that farmers routinely make complex decisions, based on a number of factors, especially regarding the adoption of agricultural technologies (Asiabaka & Owens, 2002). Some of these factors, as asserted by Asiabaka, Morse & Kenyon (2001) in Asiabaka et al. (2002) range from farmers' personal characteristics to the complexity, compatibility and knowledge of the technology.

## Methods of Data Collection

- The population for the study comprised all sweet potato farmers in Abia State. Multi-stage, purposive and snowball sampling procedures were used in selecting sixty respondents (thirty adopters and non-adopters each). Structured interview schedule was used in collecting the essential quantitative data from the sampled respondents.
- To assess farmers level of knowledge on the production of OFSP variety, the respondents were required to tick 'yes' or 'no' against each of eighteen sets of positive and negative statements measuring knowledge. They were eventually categorized into low knowledge, moderate knowledge, and high knowledge. The rate of adoption of each OFSP technology among the adopters was measured using the framework developed by Ovwigho (n.d.) which is the Sigma score method on the five adoption stages namely; awareness, interest, evaluation, trial, and adoption.
- Quantitative data were analyzed using descriptive statistical tools such as percentage, frequencies and mean scores.

## Purpose of the Study

The purpose was aimed to conduct a comparative analysis of the factors affecting the adoption and non-adoption of OFSP among rural farmers. Specifically, the study sought to:

- ascertain the respondents' sources of information on OFSP production;
- examine the knowledge level of both adopters and non-adopters on the production of OFSP;
- determine the adoption rate of OFSP production technology among adopters;
- determine the motivational factors that influenced the adoption of the OFSP among adopters; and
- ascertain the constraining factors that inhibited the adoption of OFSP among non-adopters.

## Results

Table 1: Sources of information on OFSP

| *Sources of information | Adopters   |  | Non-Adopters |  |
|-------------------------|------------|--|--------------|--|
|                         | Percentage |  | Percentage   |  |
| Extension agents        | 10.0       |  | -            |  |

## Results (contd.)

Figure 1: Knowledge level of non-adopters on OFSP production techniques

Figure 2: Knowledge level of adopters on OFSP production techniques

## Rate of adoption of OFSP production technologies among adopters

- A greater percent (23.3%) of the adopters had an adoption score of 24, while only 3.3% of them had an adoption score of 35 which shows that the majority of them were still in their early stage of adopting OFSP production technologies.

Table 3: Motivational factors affecting the adoption of OFSP among adopters

| Variables  | Mean  | Std. Deviation |
|--|-------|----------------|
| Pleasant taste of OFSP                                   | 2.99* | 0.553          |
| Profit from sale of OFSP roots                           | 2.75* | 0.721          |
| Profit from sale of OFSP vines                           | 2.47* | 0.697          |
| High consumer preference                                 | 0.77  | 1.357          |
| Availability of market for the sale of OFSP product      | 1.27  | 0.650          |
| Adequate knowledge of OFSP                               | 1.30  | 1.622          |
| Relative cheaper cost of innovation                      | 0.37  | 0.999          |
| Simplicity in using the recommended production practices | 1.47  | 1.224          |
| Moderate price of herbicide                              | 0.13  | 0.507          |
| Moderate price of inorganic fertilizer                   | 0.30  | 0.852          |
| Access to OFSP vines                                     | 0.53  | 1.224          |
| Availability of OFSP vines                               | 1.20  | 1.769          |
| Availability of credit                                   | 1.83  | 1.840          |
| Availability of labor                                    | 0.63  | 1.326          |
| Combatte vitamin A deficiency                            | 0.40  | 1.221          |
| High yield of OFSP                                       | 1.95  | 0.832          |
| Nutrient content of OFSP                                 | 0.13  | 0.730          |
| Other health benefits of OFSP                            | 0.13  | 0.730          |

\*Motivational factors

Table 4: Perceived constraints to the adoption of OFSP among non-adopters

| Variables  | Mean  | Std. Deviation |
|--|-------|----------------|
| Low soil fertility   | 0.17  | 0.648          |
| Low consumer preference associated with sweet potato product                           | 0.73  | 1.202          |
| Lack of market to sell increased quantity of OFSP being produced                       | 1.10  | 1.517          |
| Unavailability of OFSP vines needed for planting                                       | 3.20* | 1.495          |
| High cost of OFSP vines needed for planting  | 1.23  | 1.921          |
| High cost of herbicide   | 1.10  | 1.626          |
| Recommended production practices are complex to carry out                              | 0.23  | 0.679          |
| Unpleasant taste of OFSP   | 0.13  | 0.730          |
| Lack of capital to carry out necessary farm activities                                 | 2.27* | 1.856          |
| Difficulty in integrating OFSP production technologies into existing production system | 0.30  | 0.794          |
| High cost of OFSP tubers   | 0.70  | 1.383          |
| Lack of knowledge about OFSP production techniques                                     | 1.67  | 1.769          |
| Lack of storage facilities   | 1.30  | 1.557          |
| High cost of inorganic fertilizer  | 1.70  | 1.685          |
| Unavailability of inorganic fertilizer   | 1.03  | 1.564          |
| Unavailability of labor  | 0.30  | 0.851          |
| Inadequate farmland  | 0.80  | 1.627          |
| Poor access to information on OFSP   | 0.13  | 0.730          |
| High cost of labor   | 0.27  | 1.015          |
| Inefficient transport system   | 0.13  | 0.730          |
| Inaccessible road to farmland  | 0.27  | 1.015          |

\*Perceived constraints

## Conclusion and Extension Implications

- The major factors that inhibited the adoption of OFSP was the unavailability of resources needed for production. Hence, in addition to creating more sensitization and awareness about OFSP, concerted efforts should be made by the extension agencies to provide adequate inputs (vines and other planting materials) so as to encourage more farmers to go into production of the vitamin A rich OFSP.
- The study underlined the importance of a well-organized institutional information provision on OFSP production technologies through demand-led extension and advisory services to the farmers.
- Also, since fellow farmers were the most preferred and frequently used source of information, extension agents should consider the impact and influence of informal sources of agricultural information and as such they should be viewed as essential sources of information and trained so as to disseminate information on OFSP effectively.
